

CLEAR-COAT FLOOR MARKING

Warehouse identification, floor marking and safety solutions.

Clear-coat floor marking is a dual system designed to improve the lifespan of line marking, in logistics and distribution facilities. Applied direct to, or after concrete preparation, the dual system floor marking and protective clear coating, withstands traffic longer than single element systems.

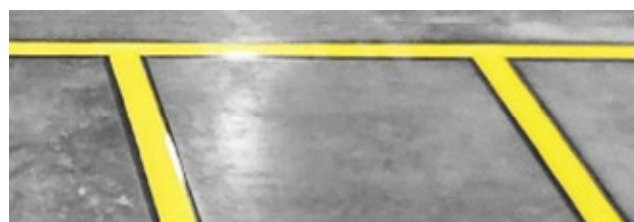

It is the premium version of two Fortega marking solutions. Available in two concrete preparation formats, clear coat marking is a dual coat system which protects and therefore elevates the solution durability.

Epoxy applied direct to concrete is a favourite of the logistics and distribution industry. It's fast to apply, can be removed, and one of the most cost-effective solutions available. If used in conjunction with a protective clear coat, this method can theoretically last twice as long due to the double layer, without being twice the cost.

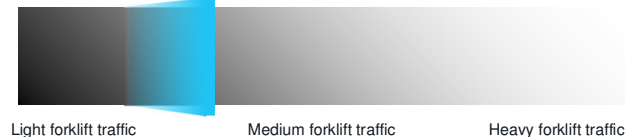

Similarly, Fortega shot blast line striping is favoured by those with a little more surety over facility layout. They can commit to a more permanent solution, so the floor is shot blasted, and a single system applied, which is a very tough option and used in some of the busiest facilities in the country. The protective clear coat can again potentially extend the lifespan to double that of the standard method.

The epoxy and urethane combination are tested and developed by our paint manufacturer, so we know chemically the system is sound, but also that the finished performance expectations can be achieved. Many completed projects over the years are testament to its success, with some customers returning over 4 years later for a recoat.
